1. INTRODUCTION

Multireg IceControl Pro is a control unit for up to two heating zones. It is designed to melt snow and ice on the ground, in stairs and on roofs and in gutters. You can control the heating in the ground and the heating cables in the gutter with one and the same system. If you are going to have two zones with ground heating, you must also have two ground sensors.

Multireg IceControl Pro is compatible with several types of ground and air sensors. The controller is used for electric heating systems. It is equipped with a simple and user-friendly menu. Read the installation instructions carefully before starting up.

2. ABOUT AUTOMATIC SNOW MELTING

With automatic snow melting, you keep it dry and ice-free throughout the winter. This contributes to both increased safety against falls and accidents when it is slippery, as well as saving work with shoveling, spreading and salting. Ground sensors can be installed in places where snow and ice problems normally occur, which gives you functional and energy-saving control of the heating cables. The sensors can be installed in concrete or asphalt, or placed under paving stones and tiles, in addition to the roof/gutter. There are also precipitation sensors for wall mounting where you cannot place the sensor in the ground.

Whether it is ice or snow on stairs, in the entrance or driveway that is the problem, a thermostat can be used to regulate the system. The thermostat receives information about temperature and humidity from a sensor, and it knows itself if there is rain or snow, and the risk of ice formation. Based on system settings and your wishes, it will ensure ice-free access to, for example, the mailbox or garage.

A pre-programmed installation procedure guides you through the setup, helping you make the choices that suit your needs. Based on your choices, the snow melt thermostat suggests the optimal settings for your configuration.

3. INSTALLATION GUIDELINES

The power supply must always be disconnected before installation or maintenance work on the control unit or on components connected to it. This control unit or components connected to it must only be installed by a registered installation company. The product must be installed and documented in accordance with the current edition of NEK 400 and the installation instructions.

How to install Multireg IceControl Pro

1. Use a flat object (e.g. a flat-head screwdriver) to bend the trigger on the DIN rail.
2. Place the top of the Multireg IceControl Pro mounting slot over the top of the DIN rail.
3. Bend the Multireg IceControl Pro towards the DIN rail until the bottom clicks into place.

Make all necessary connections to the device, and reconnect the power once all connections are made.

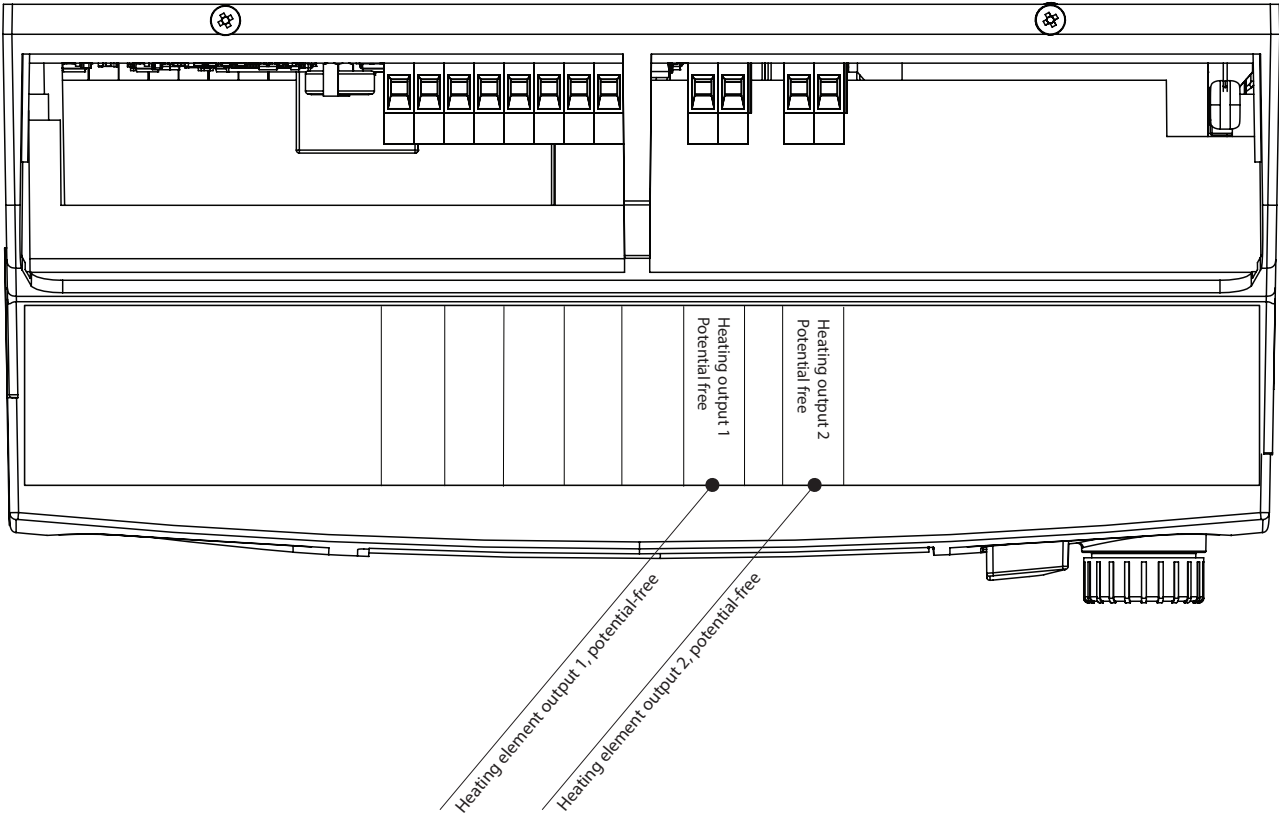

PREPARATION AND CONNECTION OF CABLES

Before connecting, the cables must be stripped of approx. 6mm. Be careful not to damage the conductors. Tighten the cables with a torque of 0.5 Nm. The cable size should be between 12 and 30 AWG.

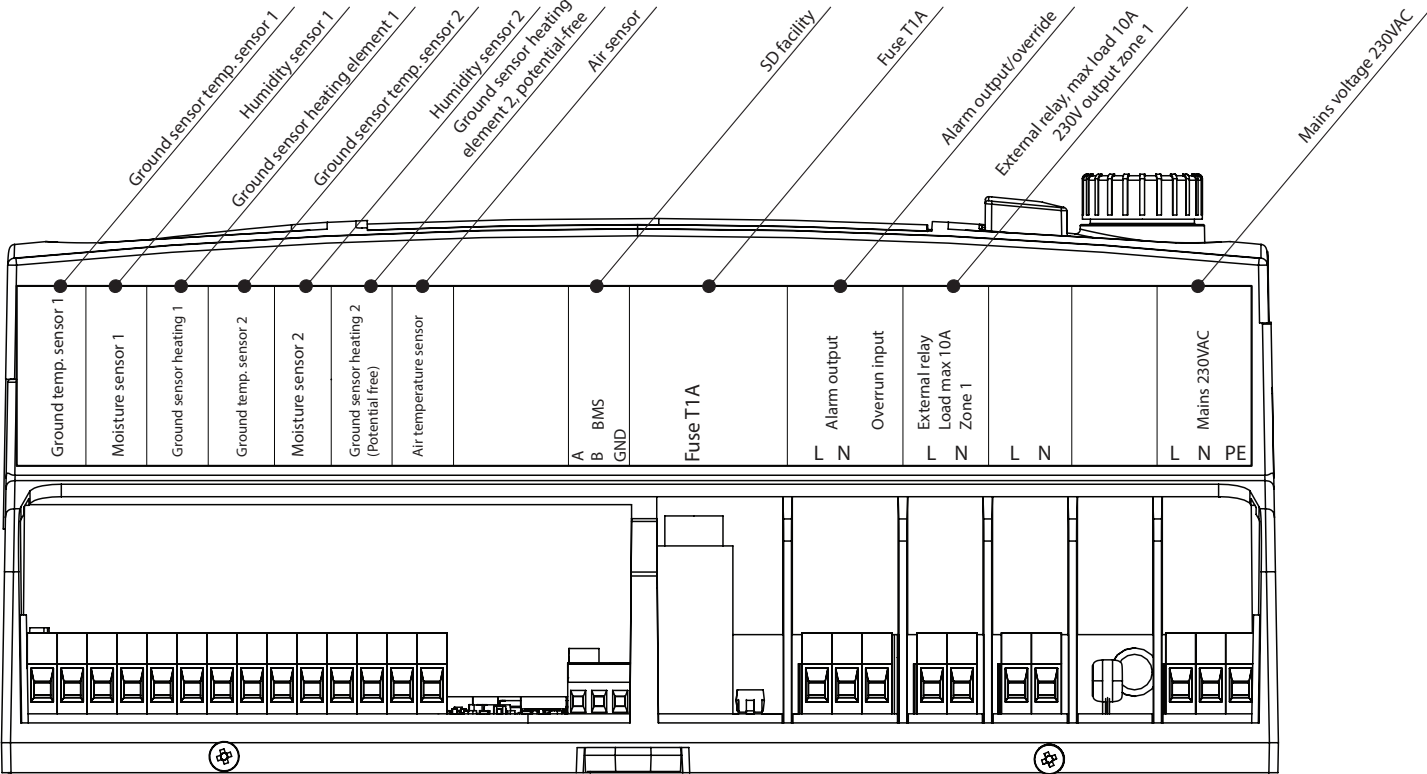

4. CONNECTION DIAGRAMS

4.1 OVERVIEW CONNECTION MULTIREG ICECONTROL PRO

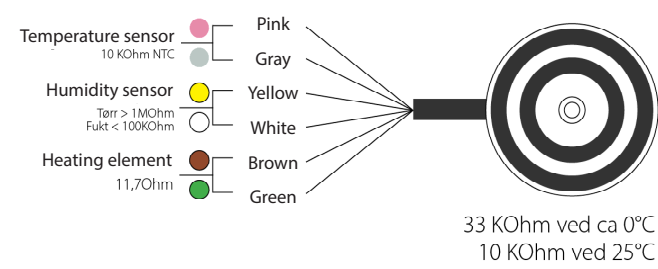

VIEW FROM THE TOP

VIEW FROM THE BOTTOM

4.2 CONNECTION DIAGRAM ICECONTROL
GROUND SENSOR TEGE

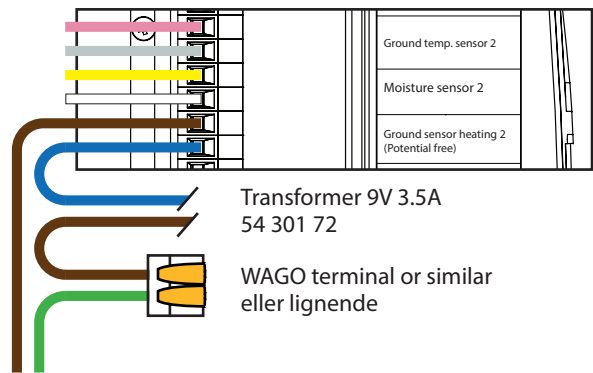

Detailed overview IceControl: connection zone 1

Detailed overview IceControl: connection zone 2

Connection of the sensor in zone 2 is only potential-free.
Operating voltage for ground sensor in zone 2 therefore requires a 9V transformer (Electrical no. 54 301 72). Operating voltage is then connected for "Ground sensor heating 2."

4.3 CONNECTION DIAGRAM ICECONTROL AIR SENSOR TF AIS

Connection details overview

4.4 GROUND SENSOR LOCATION

Join the two parts of the mounting cross together. Place the cross in the heated zone between two loops as shown in the illustration. The top of the ground sensor should, when the cover is in place, be flush with the ground.

Add a minimum of 20mm of pull pipe to the mounting junction so that the sensor can be pulled in after the asphalt/paving stones etc. are in place. This also makes any replacement of the ground sensor easier.

Make sure that the chosen location of the ground sensor is exposed to precipitation and provides an accurate picture of the snow and ice problem on the entire area to be heated.

5. FIRST TIME STARTUP/RESTART

Multireg IceControl Pro is equipped with three control buttons to the right of the display on the front of the unit. The wheel is turned to scroll through the menu and pressed in. Selecting ESC returns you to the previous selection, while the "home" button takes you back to the main screen on the display which shows the status of the selections made.

- Select language. Turn the wheel until the desired language is highlighted. Press the wheel in to acknowledge.
- Select time format. 24 is recommended.
- Select date and time. The order is year - month - day - time.
- Choose between Celsius and Fahrenheit.
- Choose between electric heating.

- Prioritizing zones – select “all zones” if the zones should defrost simultaneously.
- Sensor 1 – enter the type of sensor connected as sensor 1. Optionally "none" if not connected (Zone 1).
- Sensor 2 – enter the type of sensor connected as sensor 2. Optionally "none" if not connected (Zone 2).
- Sensor 3 air – “TF AIS” or “user defined” if the air sensor is of a different type.
- Set heating in zone 1 - select "heat on" if heating connected to zone 1 should be active.
- Set heating in zone 2 - select "heat on" if heating connected to zone 2 should be active.

NB! If you select "heating off", the system will not turn on even if the sensors are activated.

The system should always be connected to an external air sensor to ensure that no one connects the system when the air temperature is higher than the selected working range.

Activation of sensors in zone 1 gives a 230V signal on output "External relay, Load max 10A" or "Heating output 1" (potential-free). Activation of sensors in zone 2 gives a signal on "Heating output 2" (potential-free)

6. MENU

For main menu press “OK” button

Thermostat status

Here you go in and turn the thermostat on or off.

Weekly programming

Here you can go in and select the start and end time for defrosting for each day of the week. Always check that the clock in the display shows the correct time. If there are days during the week that you do not want defrosting (e.g. weekend), select the same time for start and end. Remember that defrosting must start well in advance before you can expect a snow- and ice-free area. With 300W per m² and freezing temperatures on the ground, we estimate that the ground temperature will increase by approx. 1 degree per hour.

Settings

Under settings you can go in and change or check the status of the choices you made at startup.

7. ADVANCED SETTINGS

Changing details on zones and sensors.

7.1 GROUND SENSOR 1

Setpoint high:
Selected maximum temperature for ground heating during operation. Default +2°C (hysteresis 0.5°C). This is also the temperature of the heating element in the sensor during standby.

Setpoint heating:
Selected temperature the system works towards at the start of a snowfall. Default value is 5°C. When this temperature is reached, the system regulates at “setpoint high” during the operating period.

Humidity:
Measurement of precipitation on the sensor.

Sensitivity:
Sensitivity of moisture measurement. 6 levels. Standard 6. Here the system is calibrated based on how it is experienced.

Heat in sensor:
Heating element in sensor. Default is on. This must be on if the sensor is used to register precipitation. If the sensor is to be used only as a temperature sensor, turn off “heat in sensor” and “humidity”.

GROUND SENSOR 2 AS GROUND SENSOR 1.

7.2 ICECONTROL AIR SENSOR TF AIS

Setpoint high: Upper limit for the air sensor's working range, max. 30°C. Default +3.0°C.
Setpoint low: Lower limit of the air sensor's working range, min. -30°C. Default -12°.

7.3 ICECONTROL GUTTER SENSOR TF TS2

Can only be connected to zone 2 using: IceControl transformer 9V Electrical no. 54 301 72 and IceControl air sensor TF AIS. Art No. 54 301 76.

See separate connection diagram 8.1

Setpoint high:	Do not adjust. (Not relevant for this product).
Heating setpoint:	Do not adjust.
Humidity:	Measurement of ice formation/humidity on the sensor.
Sensitivity:	Sensitivity of moisture measurement. 6 levels. Standard 4. Here the system can be calibrated based on experience at the individual system.
Heat in sensor:	Heating element in sensor. This must be on if the sensor is used to detect ice formation/moisture.

7.4 ICECONTROL RAIN AND SNOW SENSOR

(Wall-mounted precipitation sensor). Only in combination with IceControl air sensor TF AIS

* Own connection diagram 8.2*

Setpoint high:	Do not adjust. (Not relevant for this product).
Heating setpoint:	Do not adjust.
Humidity:	Measurement of precipitation on the sensor.
Sensitivity:	Sensitivity of moisture measurement. 6 levels. Standard 4. Here the system can be calibrated based on experience at the individual system.
Sensor heating:	Heating element in sensor. This must be on if the sensor is used to detect precipitation.

7.5 OTHER POINTS ADVANCED SETTINGS

Defrost zone 1 / Defrost zone 2

Here you can set the time that the system should be switched on after the sensor is dry. The system will then regulate to the temperature selected under "setpoint high", ground sensor. The optimal time for defrosting can vary depending on the region and area of use, so here you can find the setting that best suits your needs. The standard is 4 hours for IceControl ground sensor TF GS and IceControl gutter sensor TF TS2. The IceControl rain and snow sensor (wall-mounted) works according to its own logic in relation to precipitation and temperature.

Temperature calibration (ground sensors and TF AIS only)

Calibration of the temperature shown on the display, against the actual temperature. Measure the temperature with an infrared thermometer directly on the sensor, and correct up or down. Be aware of external influences such as sunlight or strong cooling. Press ok to read the measured temperature.

Set high and low temperature

Working range for Multireg IceControl Pro. Standard +10°C to -20°C. Can be used to limit unnecessary defrosting at high or low temperatures.

Consumption

Enter the power per heating zone. The system will then indicate consumption in kWh on the display. The consumption indicated is total consumption from start-up. This can only be reset by running factory settings.

Heating on (forced)

Forced heating. Heating will then be within what is selected as "after-defrost" under advanced settings. It then regulates at "setpoint high".

Restore factory settings

Code 2816.

7.6 SYSTEM INFORMATION

Quick overview of what information has been entered.

8. CONNECTING OTHER SENSORS

**8.1 CONNECTION DIAGRAM
ICECONTROL GUTTER SENSOR TF TS2 (ZONE 2 ONLY)**

**Connection
sensor +
transformer.**

**8.2 CONNECTION DIAGRAM WALL-MOUNTED
ICECONTROL RAIN AND SNOW SENSOR**

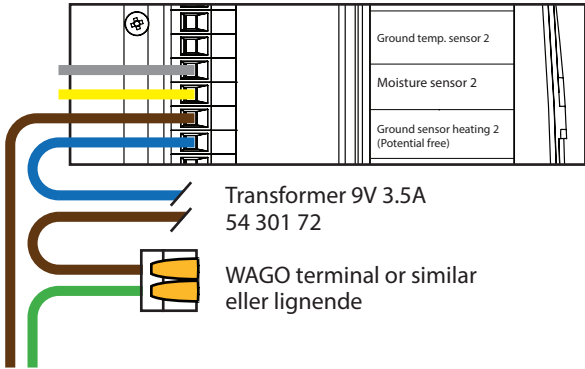

Connection of sensor on zone 2 is only potential-free.
Connection of sensor with heating element on zone 2 therefore requires a 9V transformer (Art no. 54 301 72).

PRODUCT INFO Multireg IceControl Pro

FEATURES

- Automatic snow melting
- Controls electric heat
- Two outputs controlling two independent zones
- Ground sensor
- Gutter sensor
- External air sensor
- Rain and snow sensor
- External override input
- Output for external error notification
- MODBUS 485

TECHNICAL DATA

Voltage	230VAC
Own consumption	Max 10Va
Contacts	2 x 16A - potential-free
Relay	1 x 10A - for direct connection
Size (LxWxH)	213 x 93 x 100mm 100mm
Height:	100mm
Check depth in cabinet and adjust DIN rail if necessary.	
DIN-rail	13 module – DIN rail
IP Code	IP20

Certification CE

EN 60730-1, EN 60730-2-9, EMC 2014/30/EU, RoHS 2011/65/EU
LVD 2014/35/EU

MAINTENANCE

The product does not require maintenance,
but it must never be covered.
